

RAPTOR™

Next-gen GPS resilience for autonomous systems

Powerful platform-agnostic software enables accurate drone navigation and coordinate extraction without GPS, unlocking autonomy at scale from the digital battlefield to the connected city.

RESILIENCE FOR EVERY MISSION

Raptor is a suite of vision-based software products that transform the resilience and reliability of unmanned systems, enabling autonomy at scale across warfighting, humanitarian and commercial operations for customers across the world.

Designed for lightweight integration with any autonomous platform, Raptor uses only a drone's native camera and Maxar's 90 million-plus sq km of global 3D terrain data to help the platform navigate with extreme precision and extract accurate ground coordinates in real-time without GPS.

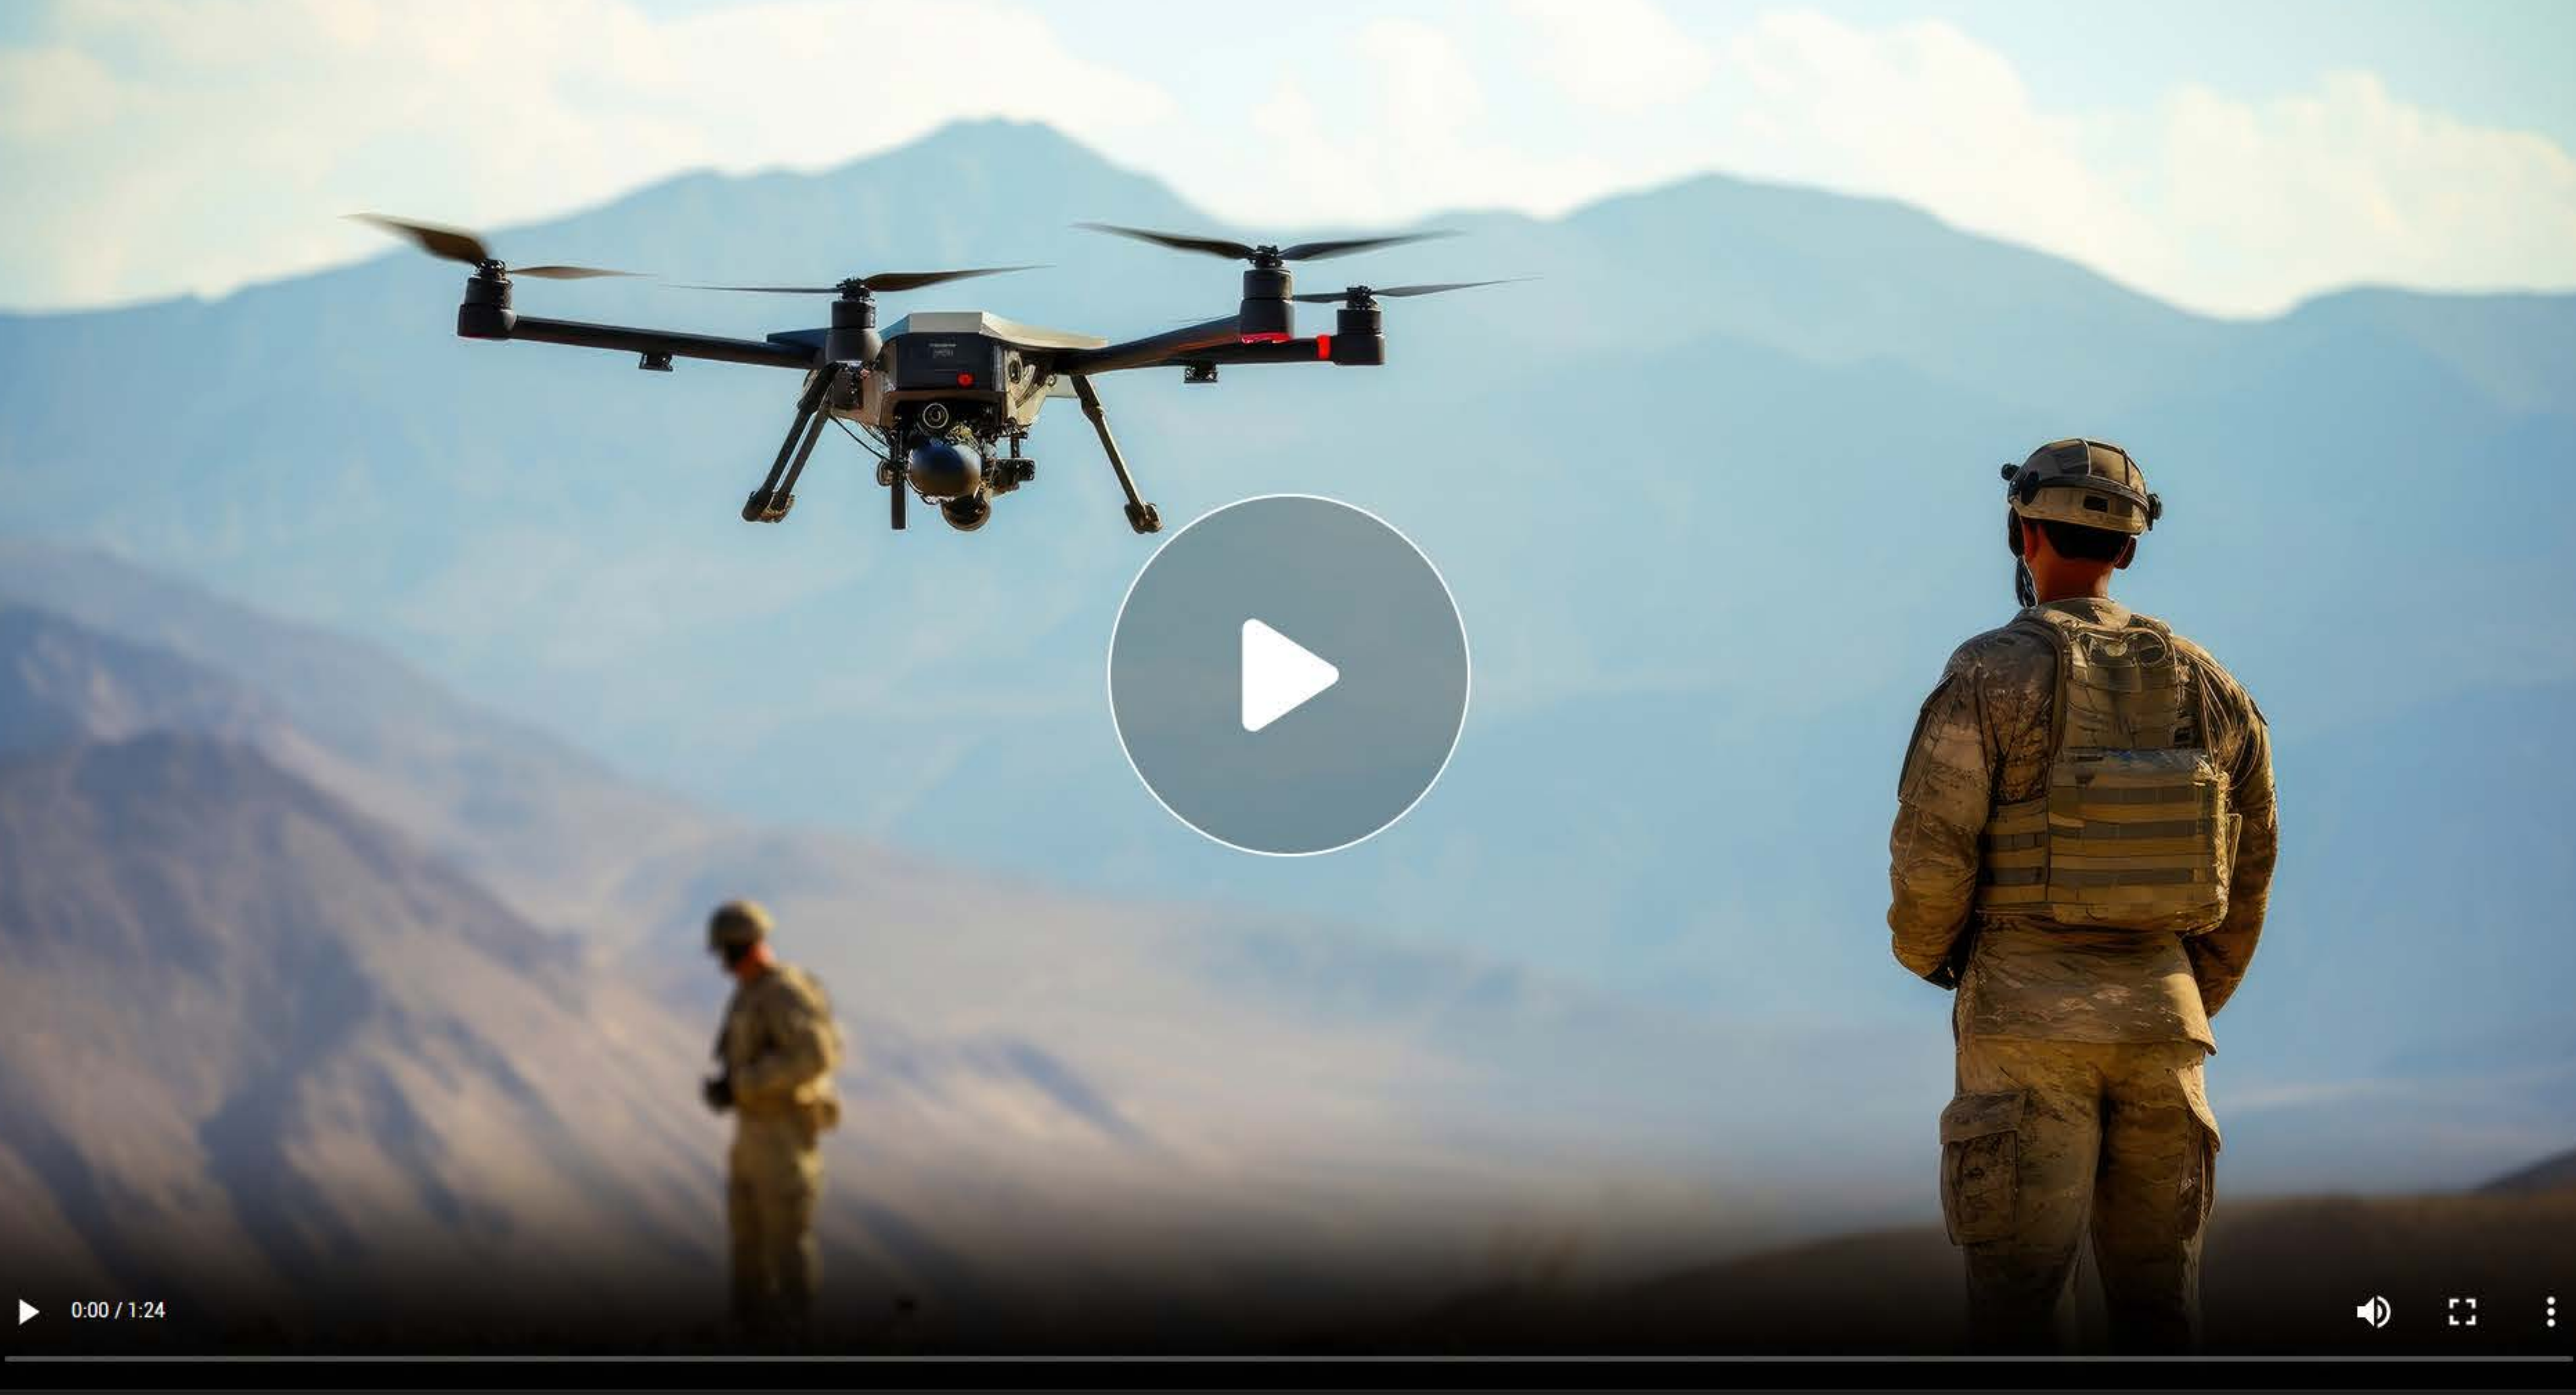

Raptor can also operate at night and in low-terrain environments. No additional hardware required.

EASILY DEPLOYABLE ON ANY PLATFORM. NO EXTRA HARDWARE REQUIRED.

EXTREME PRECISION AND ACCURACY

Raptor solutions have demonstrated absolute accuracy of <7 m RMSE for determining the UAV's aerial position and absolute accuracy of within 3 m for ground coordinate extraction.

DRAWN ON UNIQUE 3D TERRAIN DATA

Raptor products all draw from Maxar's 90M+ sq km of highly accurate 3D terrain data (3 m SE90 accuracy), which is regularly updated to provide a reliable view of the operational terrain.

SUPPORTS COMPLEX MISSION PROFILES

Built on a true 3D representation of the operational terrain, Raptor products operate at night, in any season, and at altitudes as low as 120 m.

ENABLES AUTONOMY AT SCALE

Raptor anchors sensor data against a common geospatial foundation, makes it possible for different unmanned systems to work together for joint operations.

POWER-EFFICIENT, EXISTING CAMERA, LIGHTWEIGHT INTEGRATION

These solutions are platform-agnostic and can use the drone's existing camera. They're easy to bring online, deployable on low-power commodity hardware.

RAPTOR PRODUCT SUITE

01. Raptor Guide™

02. Raptor Sync™

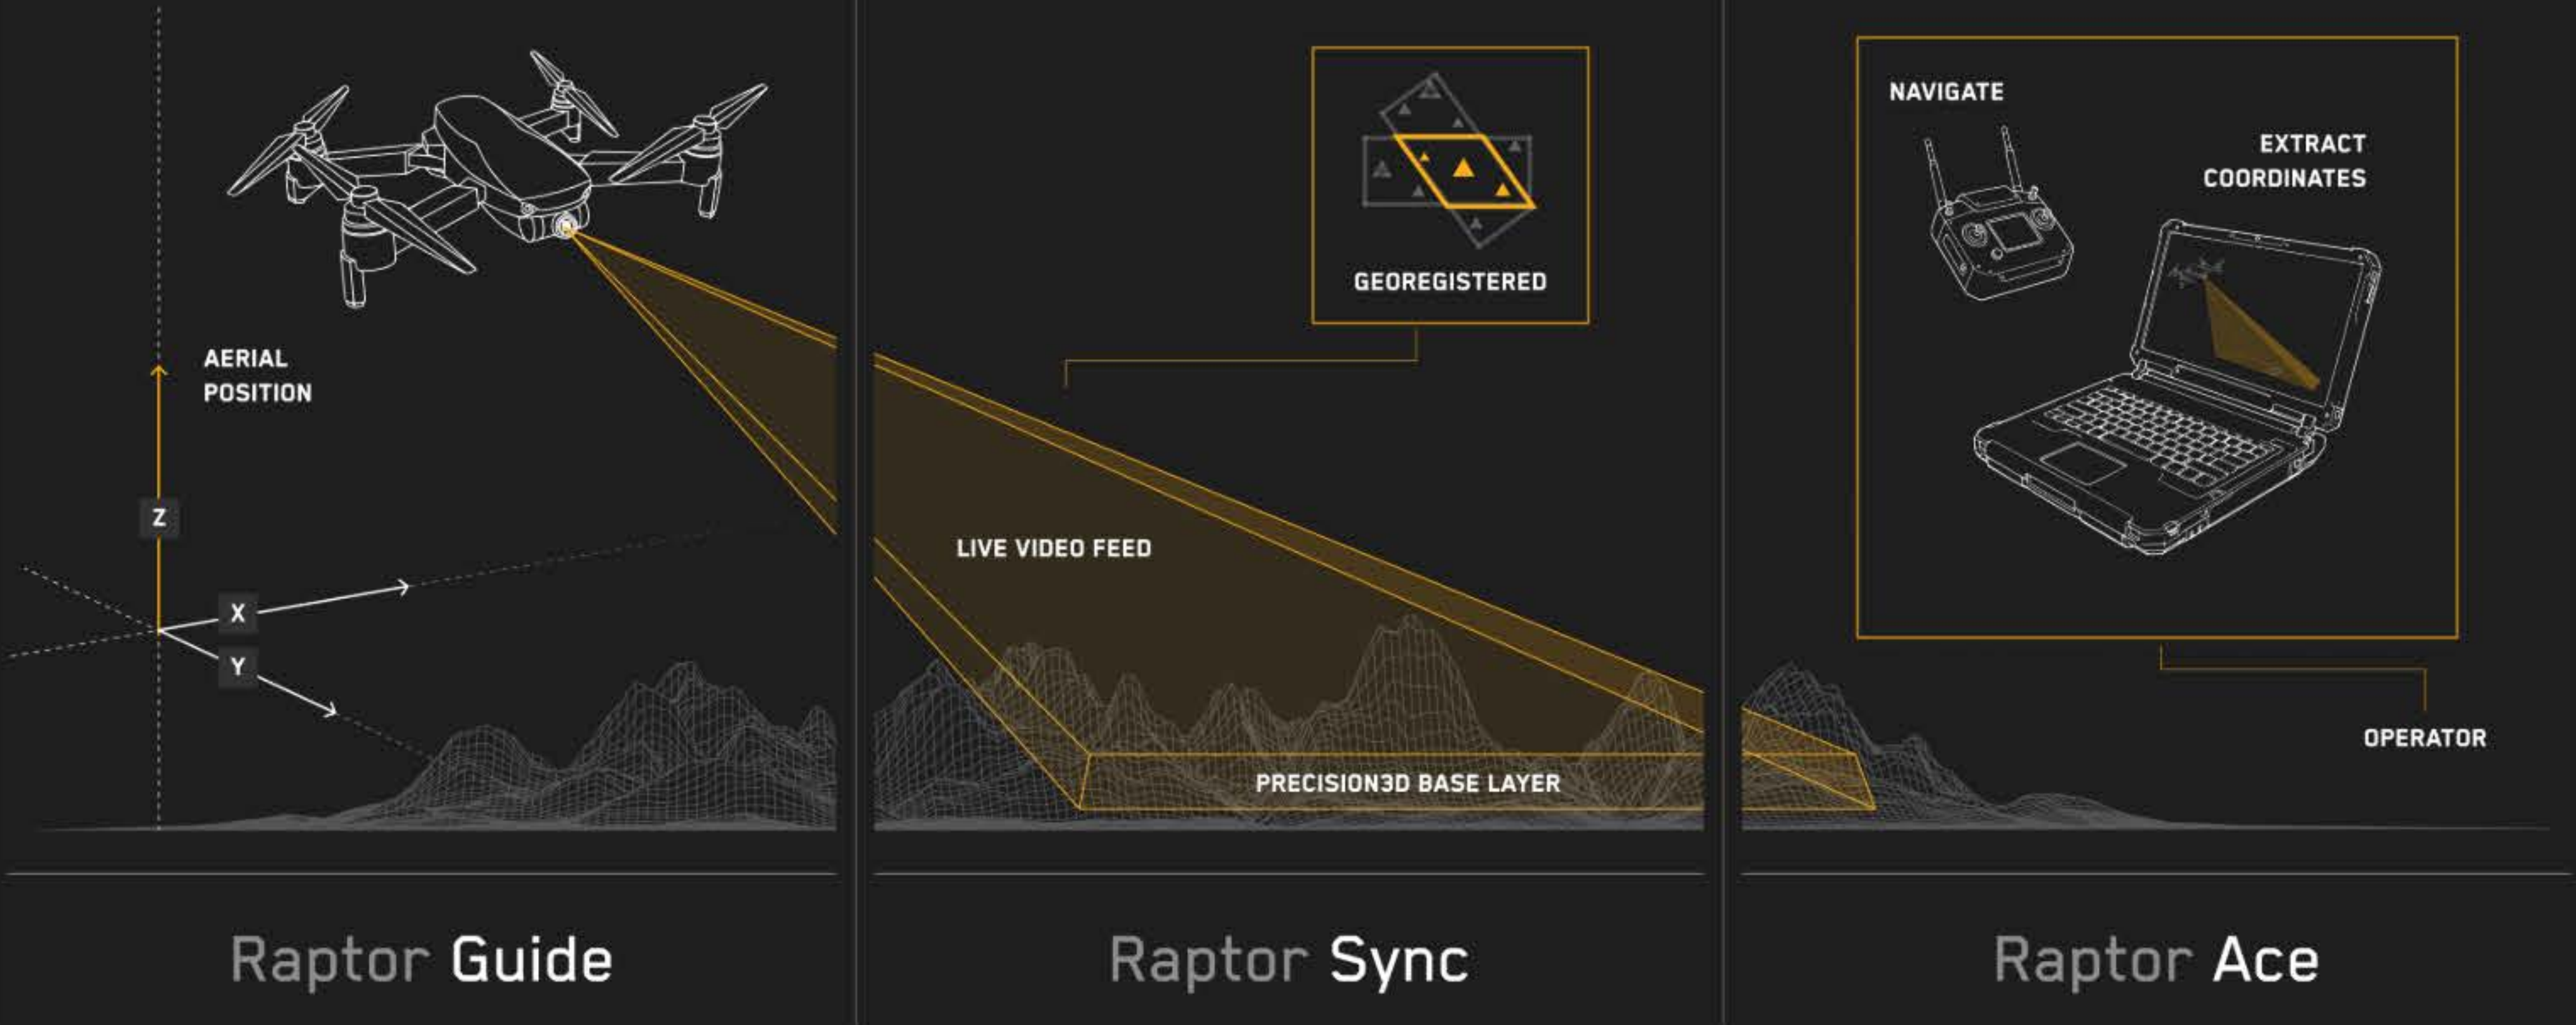

03. Raptor Ace™

Navigate with certainty

Vision-based positioning software loaded directly onto the drone that enables the platform to determine its aerial position with demonstrated absolute accuracy of <10 m RMSE. The software works with commodity on-board camera systems, using the camera's live video feed, Maxar's 3-meter accurate Precision3D terrain data and proprietary algorithms to determine the drone's position, feeding that data to the drone's navigation system.

HOW IT WORKS

FROM THE DIGITAL BATTLEFIELD TO THE CONNECTED CITY

01. Joint multi-domain operations

02. Large-scale autonomous delivery systems

Commercial logistics companies are building large-scaled autonomous delivery systems. With Raptor, urban canyons are no longer a barrier to reliability, and drones can drop off packages with precision at scale.

03. Search and rescue
